Platform Operational Guide and Workflows

Welcome to the official **Prado Systems** user guide, the core engine specifically designed to streamline production, dispatch logistics, sales pipelines, and financial administration within a single, unified environment. This document highlights critical operational workflows and answers frequently asked questions regarding our platform's layout.

1. Step-by-Step Critical Workflows

A. Commercial Management: From Opportunity to Production

1. **Customer Registration in CRM:** Access the **Customer CRM** module on the left navigation panel. Use the prompt to add a new customer by completing their corporate details, contact profiles, and initial operational requirements.
2. **Drafting Estimates:** Head over to the **Estimates** section. Develop a proposal detailing requested materials, architectural coatings, or paint formulations, generating a clean and professional quote for your client.
3. **Digital Approval:** Present the proposal to your client. Once confirmed and internally validated, update the estimate's status to approved.
4. **Direct Conversion to Work Order:** With the approved estimate, the platform automatically enables the option to push operational details into the plant scheduling module. This eliminates duplicate data entry and accelerates the value chain.

B. Plant Execution and Dispatch Logistics

1. **Operational Planning (Job Scheduling):** Transferred work orders immediately appear on the task scheduler. Supervisors can allocate each job to a specific operator, mixing tank, or work shift within the master calendar framework.
2. **Real-Time Status Tracking:** As the team progresses through color matching or batch manufacturing, the task status updates in real time until it is marked as completed.
3. **Dispatch Route Optimization (Dispatch Routing):** Finalized batches are consolidated within the dispatch module. The logistics coordinator builds the most efficient delivery paths and assigns the corresponding fleet vehicles, generating manifest sheets for the drivers.

C. Financial Cycle and Accounting Sincronization

1. **Invoice Issuance:** Once the product is delivered, access the ****Invoices Ledger**** to finalize accounts receivable for the completed job, instantly updating your workspace revenue tracking charts.

2. **Plant Outlay Tracking:** Record any procurement of supplies, raw materials, or unexpected production costs directly in the ****Expense Ledger****.
3. **Automated Accounting Link:** Through a secure integration with platforms like Xero, logged outlays can be dispatched with a single click. The system generates an accounts payable bill draft directly inside your accounting backend, maintaining absolute consistency between operations and financial books.

Efficiency Note: All financial and operational metrics consolidated across these workflows are aggregated instantly inside the Prado **Overview Terminal**, providing high-level performance insights at a single glance.

2. Frequently Asked Questions and Workspace Structure

How does Prado scale with the size of my organization?

Prado is built on a highly flexible model. We offer tailored service tiers suitable for independent contractors operating solo, optimized environments for growing workshops that need to connect teams of up to 5 user roles, and unlimited enterprise solutions for mid-sized to large organizations managing complex multi-department frameworks.

How does the financial integration handle secure data syncing?

Prado leverages advanced OAuth 2.0 protocols to connect externally with accounting platforms like Xero. This guarantees an encrypted data exchange without storing critical banking credentials. When an outlay is synchronized, it is staged as a draft to allow for proper administrative review and bookkeeping audit before final posting.

What access roles are available for my team members?

To safeguard workspace security, Prado features 5 clearly defined access profiles:

- **Owner:** Full access to the workspace, global system settings, and subscription management tools.
- **Manager:** Workspace-wide visibility, team member administration, and general operations adjustments.
- **Supervisor / Coordinator:** Active day-to-day coordination capabilities (CRM, Estimates, Job Scheduling) without access to critical billing areas.
- **Accountant:** Specialized access to invoice lifecycles, expense ledgers, and external accounting synchronization pipelines.
- **Analyst / Observer:** A secure read-only profile ideal for external audits or passive monitoring of metrics and analytical dashboards.

Can I migrate historical business data into Prado?

Yes. Utilizing the **Import / Export** module, administrators can batch-upload customer directories and initial inventory sheets using standard CSV or spreadsheet formats, ensuring a fast and smooth transition from legacy platforms.
